Intended Use

The MagPurix® cfDNA Extraction Kit LV utilizes unique magnetic ZiBeads® technology for automated isolation and purification of circulating cell-free DNA (cfDNA) from cell-free samples, such as plasma, or from a pool of cell-free body fluids.

The product is intended to be used by professional users, such as technicians and physicians who are trained in molecular biology techniques.

Introduction

Product Name	MagPurix® cfDNA Extraction Kit LV
Catalogue Number	ZP02025
Product Overview	The MagPurix® cfDNA Extraction Kit LV is designed to extract cfDNA from cell-free samples, such as plasma, or from a pool of cell-free body fluids using MagPurix® EVO series automatic instruments. The kit is applied with unique magnetic ZiBeads® technology, which achieves superior product quality, consistent and high product yield and reproducible results. The final product is suitable for a wide range of diagnostic and research applications, including sequencing, genotyping and qPCR detection.
Applicable Instrument Model	MagPurix® EVO Instruments
Display Protocol Name on The Instrument	2025 cfDNA LV
Applicable Instrument	Check and download the latest firmware from
Firmware	www.zinexts.com
Processing Time	MagPurix® EVO series 45-52 minutes

Kit Contents and Storage

Shipping and Storage	The kit is shipped at room temperature. Upon receipt, store the kit at room temperature. All kit components are stable when stored properly until the expiration date shown on the kit box.	
Kit Content	The components supplied in the kit are listed below.	
	Sufficient reagents are supplied to perform 48 purifications.	
	Contents	Amount
	Reagent Cartridge	48 pcs (6x8)
	2 Reaction Chamber 48 pcs (6x8)	
	3 Tip Holder 48 pcs (6x8)	
	4 Piercing Pin 50 pcs	
	5 Filter Tip 50 pcs	
	6 Sample Tube (7 ml)	50 pcs (25x2)

7 Elution Tube (1.5 ml)	50 pcs
S Small Tip	50 pcs
LB1 Buffer (300 ml)	1 pc
Magnetic Bead Solution C (6 ml)	1 pc
Barcode Sticker	50 pcs

Reagent Cartridge Contents Each Reagent Cartridge has 10 positions with 10 sealed well. Positions 1-10 contain wells filled reagents for this protocol

Reagent	Well No.
Empty	1
Empty	2
Empty	3
Empty	4
Washing Buffer 8	5
Washing Buffer 8	6
Washing Buffer A	7
Washing Buffer B	8
Elution Buffer 3	9
Empty	10

Materials Required But Not Provided

The following general laboratory equipment and consumables are required to perform the extraction. All laboratory equipment should be installed, calibrated, operated, and maintained according to the manufacturer's recommendations. The following table lists the required equipment and consumables.

For all	purification procedures:
1. Mag	gPurix [®] EVO series instrument
2. 1.5	or 2.0 ml microcentrifuge tubes
3. Pipe	ettes and filter tips
4. Pho	osphate-buffered saline (PBS, may be required for diluting samples)
5. Sar	nple Rack for 7 ml Sample Tubes
6. Opt	tional: Plastic consumables, DNase-free RNase A (to minimize RNA content),
Pro	teinase K (20 mg/ml), Sodium dodecyl sulfate (SDS) solution (20%, w/v)
7. Opt	tional: Streck Cell-Free DNA BCT tube

Warnings and Precautions

For *in vitro* diagnostic use only. Read all the instructions carefully before using the kit. Use of this product should be limited to trained personnel in the techniques of DNA purification. Strict compliance with the user manual is required for optimal results. Attention should be paid to expiration dates printed on the box and labels of all components. Do not use a kit after its expiration date.

When working with chemicals, always wear a suitable lab coat, disposable gloves, and protective goggles. For more information, please consult the appropriate safety data sheets (SDSs). These are available online in convenient and compact PDF format at MSDS (Material Safety Data Sheets) – Downloads – www.zinexts.com.

Please report any serious incident occurred in relation to the device to your local representative/ agent or the manufacturer, and to the competent authority of your country/state.

CAUTION: DO NOT add bleach or acidic solutions directly to the sample preparation waste.

Purification Principle

- Perform certain pretreatment process before extraction.
- B Transfer sample to extraction directly.

Things to Do Before Starting

Sample Preparation

The purification procedure is optimized for the use of 2-5 ml of plasma* samples.

Plasma*

Lysis/binding section:

- a. Aliquot 2-5 ml samples to an appropriately sized tube.
- b. Add 1.25 ml LB1 Buffer for every 1 ml of sample.
- c. Add 25 µl Magnetic Beads Solution C for every 1 ml of sample.
- d. Vortex or shake the tube vigorously for 10 minutes at room temperature.
- e. Place the tube on the magnetic stand for 5 minutes or until the solution is clear.
- f. While keeping the tube on the magnetic stand, remove supernatant. Be careful not to remove magnetic particles.
- g. Keep the tube on the magnetic stand for 1 minute, and then remove residual supernatant.
- h. Leave 1 ml lysate (with magnetic beads) and transfer into each 7 ml Sample Tube.

Table 1 – The recommended tube size with its corresponding LB1 Buffer and Magnetic Beads Solution C volume according to sample volume

Sample volume	LB1 Buffer	Magnetic Beads Solution C	Recommended tube(s) size
x (x = ml of sample)	1.25x	0.025x	n/a
2 ml	2.5 ml	50 μl	15 ml
5 ml	6.25 ml	125 µl	50 ml

Optional: Proteinase K Treatment

If samples were collected using a Streck Cell-Free DNA BCT tube:

- a. Aliquot 2-5 ml samples to an appropriately sized tube.
- b. Add 15 µl Proteinase K (20 mg/ml) for every 1 ml of plasma.
- c. Add 50 µl 20% SDS solution for every 1 ml of plasma.
- d. Mix by inverting gently for 5 times.
- e. Incubate at 60°C for 20 minutes.
- f. After incubation, place the tube on ice for 5 minutes to cool the tube to room temperature.
- g. Once the tube has cooled, proceed to the Lysis/binding section.

Note:

Plasma must be prepared from fresh or frozen blood samples collected in tubes that contain common anti-coagulants like EDTA and citrate. (Heparin has inhibitory effects on nucleic acid amplification reaction).

If samples were collected using a **Streck Cell-Free DNA BCT tube**, Proteinase K treatment is required to ensure optimal yields. If blood was not collected with **Streck Cell-Free DNA BCT tube**, proceed to the Lysis/Binding step.

Using Magnetic Beads Solution C:

Mix beads well prior to adding. There should be no visible sedimentation at the bottom of the solution after mixing. Beads will settle quickly, so be sure to mix the Magnetic Bead Solution C after adding to each sample. Insufficient mixing may result in inconsistent yields.

Method of Vortex/shaking:

To obtain high yields, ensure that plasma/buffer solution is mixed vigorously in the tube. A vortex mixer with a tube-holder can allow walk-away mixing, which will make the mixing easier.

Using fresh sample (stored at 2-8°C for up to 6 hours) for extraction is recommended. Total nucleic acid yield and quality will decrease with time or after multiple freeze-thaw cycles. For longer storage time, samples should be frozen at -20°C or lower and avoid freeze-thaw cycles. Thaw samples at room temperature (15-25°C) and process the sample immediately after the temperature reaches to room temperature. **Do not** refreeze sample after thawing. If precipitation is visible in sample, centrifuge at 6,800 x g for 3 minutes and transfer supernatant to a new tube without disturbing the precipitate, and immediately start the purification procedure.

Table A – The suggested starting material and elution volume range for each nucleic acid extraction			
Sample type	Starting material per sample	Elution Volume	
Plasma	2000-5000 μΙ	50-200 μl	

Procedure of MagPurix System

Workflow of MagPurix operation

^{*} Output the bench record (option)

Purification Protocol - MagPurix® EVO series

1	Turn on the	a.	Turn on the power switch and wait for the screen to turn on.	
	Instrument	b.	Login the instrument and enter the Home Page.	
2	Load new	a.	Open the door and remove the Sample Rack from the instrument.	
_	Consumable(s)	b.	Open the Tip-Holder Lid.	
	and	C.	Load IReagent Cartridge and all plastic disposables (2 Reaction	
	Cartridge(s)		Chamber, 3 Tip Holder, 4 Piercing Pins, 5 Filter Tips and other	
			components presented in the kit intended to use).	
		d.	Close the Tip-Holder Lid.	
		e.	Paste the Barcode Stickers on Elution Tubes.	
		f.	Place 6 Sample Tubes and 7 Elution Tubes into the Sample Rack.	
3	Load the	a.	Transfer appropriate volume of sample into each Sample Tube on the	
J	Samples		Sample Rack.	
		b.	Put the Sample Rack back into the instrument and close the door.	
4	Program Set	a.	Select the appropriate protocol program on the instrument. Press	
	up	h	NEXT.	
		b.	Select the appropriate Sample Volume and Elution Volume and press NEXT .	
		C.	Press the number button to select the right Sample Numbers.	
		d.	Scan/Edit each primary Sample ID directly. After finished, press NEXT .	
		e.	Scan/Edit each Elution Tube ID directly. After finished, press NEXT .	
		f.	Scan Reagent Cartridge Barcode. Press NEXT .	
			*If the cartridge is expired, the next step cannot be performed.	
		g.	Follow the instructions on the screen to double-check the operating	
			steps being completed before running the program. Press NEXT .

Limited Product Warranty

Zinexts Life Science is committed to provide customers with high-quality products and services. Our goal is to ensure that every customer is 100% satisfied with our products and services. If you have any question or concerns, contact our Technical Support Representatives.

Zinexts Life Science guarantees the performance of all products according to the specifications stated in our product literature. The purchasers/users must determine the suitability of the product for their particular use. We reserve the right to change, alter, or modify any product to enhance its performance and design.

This warranty limits Zinexts Life Science Corporation's liability only to the cost of the product. No warranty is granted for products beyond their listed expiration date. No warranty is applicable unless all product components are stored and used in accordance with instructions.
